

Security Incident Report

Wazuh Alert – CVE-2023-47359 / CVE-2023-47360

1. Alert

Source	Wazuh SIEM
Type	Vulnerability Detection (Version-based)
Severity	High (CVSS 7.5)
Affected Asset	Windows Endpoint
Vulnerability	CVE-2023-47359 / 47360
Description	Heap-based buffer overflow in VLC Media Player (MMS handling)
Detected Version	VLC 3.0.16 (Vulnerable < 3.0.20)

2. Investigation

Data Sources: Wazuh alerts, software inventory, Windows logs.

Findings:

- VLC version confirmed vulnerable
- No suspicious process execution
- No abnormal network activity
- No malicious file interaction observed

3. Analysis

The alert was triggered by version correlation, not behavior.

Conclusion:

- No active compromise detected
- Valid vulnerability exposure exists

4. MITRE ATT&CK;

T1204 – User Execution (requires user interaction)

5. Response

- Upgraded VLC to 3.0.20
- Removed vulnerable version
- Verified remediation via re-scan

6. Key Takeaway

Distinguishing between vulnerability exposure and active exploitation is critical in SOC analysis.
